

Inputs:

Lot value=.01

XBars=5

Strategy should first check:

Scale G

Each indicator will create a value 1 – 100.

50 = flat

100 = short 10 lots

0 = long 10 lots

Add all value then divide by Total amount of Indicators (ABCD) for example $475 / 5$ to give you final 1-100 value. Strategy buys / sells currency pair based on that value.

Indicators

A RSI

Rsi can be translated directly into 1-100 value.

B Bollinger (using signal generator such as intrepidus)

C MACD

D CCI

E Stochastics

Money management module checks "Value" every x bars, and opens amount of positions based on value, using scale G.
